Business-led data migration

KPMG Powered Enterprise | Data migration enabled by Informatica

Your business is continuously evolving. You acquire and merge systems, apply new business models and take advantage of streamlined technologies. As you change, your data must migrate with you and take on new configurations. The importance of clean, accurate data is a critical component of your transformation strategy—and shouldn't be compromised.

How can you reduce data migration risk?

Whether you are moving applications to the cloud, transforming legacy systems or combining multiple business entities, a clear, business-driven data migration strategy has never been more important.

As data is moving from multiple sources and systems, it must still provide complete and accurate insights and function as expected. Yet we see many examples of failed or incomplete projects where poor data migration is the culprit. Migrations are often under or inappropriately resourced—and the impact is significant. This can result in expensive remediation to address data gaps.

Key considerations to address in your next migration:

What data should be migrated?

Where is the data currently, and what state is it in?

How much effort is required to cleanse or remediate it?

How can the data be migrated to achieve the most business impact, and within the timeframe we have?

What security, risk, legal and compliance issues are involved?

What success factors will the business invoke?

What technology should be used?

KPMG and Informatica: a holistic approach

KPMG Powered Data Migration enabled by Informatica provides a different approach to data migration. It offers a business-led solution that will help you eliminate many of the pitfalls of traditional technology-only processes which tend to focus on extract/transfer/load (ETL) models—and are often not enough to achieve clean, functional data transfer.
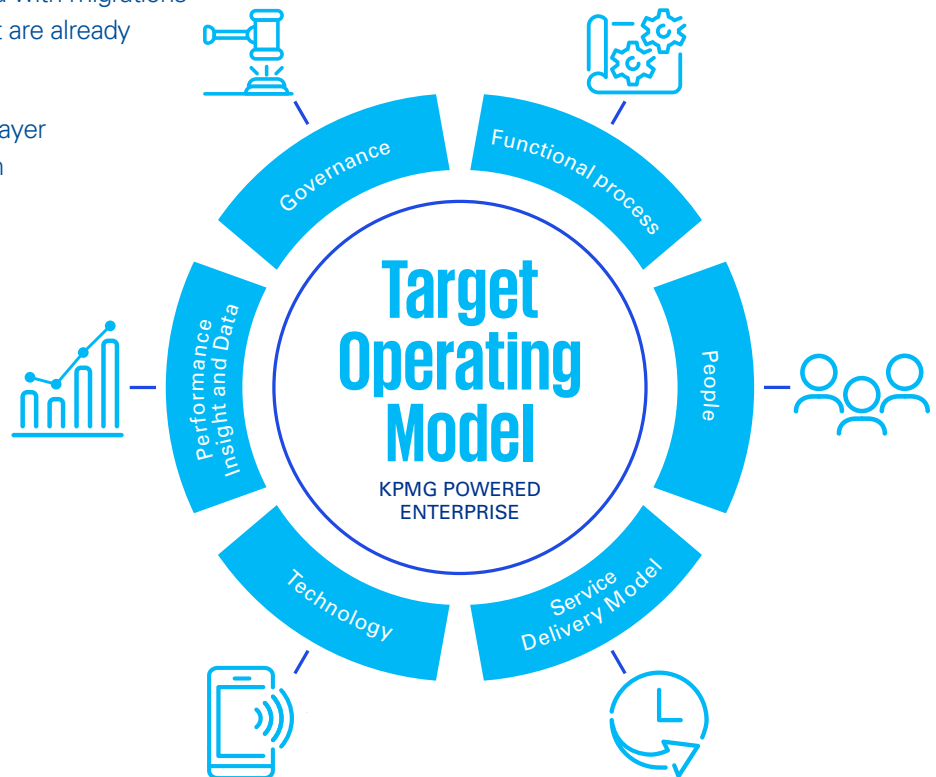

With Powered Data Migration, you can put an end-to-end strategy in place that considers all the planning, processes, people and technologies that should be involved in data migration. Our pre-built accelerators help you quickly employ Informatica software to get to value faster. You'll not only have access to ETL functionality, analytics and visualization dashboards, but you'll also be able to take advantage of KPMG business, risk, legal and compliance experience.

And with a variety of service delivery options, we can provide a lighter touch solution that is faster to implement, or a more comprehensive one that supports multi-phased global migrations.

With Powered Data Migration, you can put an end-to-end strategy in place that considers all the planning, processes, people and technologies that should be involved in data migration.

What's included with KPMG Powered Data Migration?

At the heart of our solution is the KPMG Target Operating Model. It was built based on years of experience with many clients going through data migration projects. It will help you understand the full implications and challenges associated with migrations and provides a suite of tools and services that are already built to work with Informatica technology.

The model is designed to work across every layer of your organization to give you the maximum benefit form your technology. And it employs next-generation implementation tools to help you unlock value and reduce risk. It helps you drive innovation and evolve your data strategy as your business continues to change.

Target Operating Model — KPMG POWERED ENTERPRISE: Governance, Functional process, People, Service Delivery Model, Technology, Performance Insight and Data

A full suite of services

Migration strategy and planning

Governance and reporting

Data mapping and transformation

Data acquisition and profiling

Output and target system load

Data quality monitoring and remediation

Reconciliation and controls

Achieve more with KPMG Powered Data Migration

— Reduce risk in data delivery

— Build confidence in complex data migrations

— Attain business transparency

— Achieve flexible, scalable, cost effective models
